				8. Repeat Steps 1-12 with Netflix and Prime Video					

* If the creation of accoung if not possible on the Mimi TV app, than create on on mibile and log in on TV

ex. 1.4.

Considering that the audio recordings are audio personalised, there some things that need to be cleared out
- the version of the hardware
- the version of the Mimi software, that the hardware manufacturer has used
- all the details about the personalisation
When we make sure that the reference processed audio file corresponds to the points above, we can continue with the testing.
If this is not the case, that we may be getting inaccurate testing results.
It is also important how the audio files have been transferred, because some platforms do compress files and there may some loss or corruption that will interfere with the testing results.
If some major discrepancies are noticed while testing, it may be helpful to connect with the hardware manufacturer and make sure that the Mimi software has been used correctly.
Any errors that have been found should be logged. After fixes are applied it is always better to retest with the actual hardware.
